

Visualizing data in Stata – Section 7.1

Najib Mozahem

In the previous section, we saw how to visualize relationships between two variables. Before that, we had also seen how to visualize group differences in a certain variable. In this section we bring both of these concepts together by showing how we can visualize group differences in the association between two variables. The next lecture will revisit box plots, bar graphs, and dot plots in order to see how we can include more than one variable in the command. The lecture after that will show how we can look at group differences using the **twoway** command.
